Sentrixi Deployment Guide

sentrixi.com — Step-by-step from zero to live

Prerequisites

- Node.js 18+ installed (nodejs.org)
- Git installed (git-scm.com)
- A GitHub account
- Your domain: `sentrixi.com` registered (Namecheap, Cloudflare, GoDaddy, etc.)

Step 1 — Set up the project folder

Open Terminal (Mac) or Command Prompt (Windows) and run:

```bash
# Create project folder
mkdir sentrixi-site
cd sentrixi-site

# Copy these files into this folder:
# - package.json
# - next.config.js
# - vercel.json
# - pages/_app.jsx
# - pages/index.jsx
# - components/SentrixiApp.jsx   ← rename sentrixi_full.jsx to this
# - public/favicon.svg
# - public/robots.txt
```

Your folder structure should look like this:

```
sentrixi-site/
├── components/
│   └── SentrixiApp.jsx        ← the main website file
├── pages/
│   ├── _app.jsx
│   └── index.jsx
├── public/
│   ├── favicon.svg
│   └── robots.txt
├── next.config.js
├── package.json
└── vercel.json
```

Step 2 — Add your GA4 Measurement ID

1. Go to analytics.google.com
2. Create a new property → Web → enter `sentrixi.com`
3. Copy your Measurement ID (looks like `G-XXXXXXXXXX`)
4. Open `pages/_app.jsx` and replace:

```js
const GA4_ID = "G-XXXXXXXXXX";
```

with your real ID. 5. Open `components/SentrixiApp.jsx` and do the same on line ~282:

```js
const GA4_ID = "G-XXXXXXXXXX";
```

Step 3 — Install dependencies & test locally

```bash
# Install packages
npm install

# Run locally to confirm everything works
npm run dev
```

Open http://localhost:3000 — you should see the Sentrixi site.

Test all 4 pages (Home, Platform, About, Contact) and confirm:

- ✅ Logo renders correctly
- ✅ Incident timeline animates
- ✅ Constellation canvas draws
- ✅ Audience tabs switch
- ✅ Email capture shows success state
- ✅ Contact form submits

Press `Ctrl+C` to stop when done.

Step 4 — Push to GitHub

```bash
# Initialize git
git init
git add .
git commit -m "Initial Sentrixi site"

# Create a new repo on github.com (name it: sentrixi-site)
# Then connect and push:
git remote add origin https://github.com/YOUR_USERNAME/sentrixi-site.git
git branch -M main
git push -u origin main
```

OPTION A — Deploy on Vercel (Recommended)

Vercel is the easiest, fastest option. Free tier is more than enough for a marketing site.

A1 — Connect to Vercel

1. Go to vercel.com → Sign up with GitHub
2. Click **"Add New Project"**
3. Select your `sentrixi-site` repository
4. Vercel auto-detects Next.js — click **Deploy**

Your site is now live on `https://sentrixi-site.vercel.app` ✅

A2 — Connect sentrixi.com domain

1. In Vercel dashboard → your project → **Settings** → **Domains**

2. Click **Add Domain** → type `sentrixi.com` → click **Add**
3. Also add `www.sentrixi.com` (Vercel will auto-redirect www → root)
4. Vercel will show you DNS records to add. Keep this tab open.

A3 — Update DNS at your domain registrar

Go to wherever you registered `sentrixi.com` (Namecheap, GoDaddy, etc.) → DNS settings:

If your registrar supports CNAME flattening (Cloudflare, Namecheap):

```
Type    Name    Value
A       @       76.76.21.21
CNAME   www     cname.vercel-dns.com
```

If not (GoDaddy, basic registrars):

```
Type    Name    Value
A       @       76.76.21.21
A       www     76.76.21.21
```

DNS propagates in 5–30 minutes. Vercel provisions SSL automatically.

A4 — Verify

Go to https://sentrixi.com — site is live with HTTPS ✅

OPTION B — Deploy on Cloudflare Pages

Use this if your domain is already on Cloudflare, or if you want Cloudflare's global CDN + DDoS protection.

B1 — Build the site

```bash
npm run build
```

This creates a `.next` folder.

B2 — Set up Cloudflare Pages

1. Go to dash.cloudflare.com → **Workers & Pages** → **Create application** → **Pages**
2. Click **Connect to Git** → select your `sentrixi-site` repo
3. Set build settings:

```
Framework preset:   Next.js
Build command:      npm run build
Build output dir:   .next
Node version:       18
```

4. Click **Save and Deploy**

> **Note:** Cloudflare Pages uses Next.js's edge runtime. Add this to `next.config.js` if you see errors:
>
> ```js
> const nextConfig = {
>  reactStrictMode: true,
>  output: 'standalone',   // add this line
>  // ... rest of config
> }
> ```

B3 — Connect sentrixi.com domain

1. In Cloudflare Pages → your project → **Custom domains** → **Set up a custom domain**
2. Type `sentrixi.com` → click **Continue**
3. If your domain is already on Cloudflare DNS, it auto-configures ✅
4. If not, Cloudflare will show you nameservers to set at your registrar:

```
NS   aria.ns.cloudflare.com
NS   tom.ns.cloudflare.com
```

(actual names will differ — use what Cloudflare shows you)

SSL is automatic with Cloudflare ✅

Step 5 — Post-launch checklist

Analytics

- [ ] Open GA4 → Real-time view → visit sentrixi.com → confirm pageview fires
- [ ] Submit a test email capture → check GA4 Events for `email_capture`
- [ ] Submit contact form → check GA4 Events for `demo_request`

SEO

- [ ] Submit sitemap: Google Search Console → Add property `sentrixi.com` → Submit `https://sentrixi.com/sitemap.xml`

- [ ] Test Open Graph at opengraph.xyz — paste your URL
- [ ] Test page speed at pagespeed.web.dev

Email capture → where does it go?

Right now, `trackEvent("email_capture")` fires to GA4 but doesn't store the email address.

To actually collect emails, add one of these (takes ~15 minutes):

Option 1 — Mailchimp (free up to 500 contacts):

1. Create a Mailchimp account → Audience → Signup forms → Embedded forms
2. Note your List ID and API Key
3. In `SentrixiApp.jsx`, in the `EmailCapture` submit handler, add:

```js
await fetch("/api/subscribe", {
  method: "POST",
  body: JSON.stringify({ email }),
  headers: { "Content-Type": "application/json" },
});
```

4. Create `pages/api/subscribe.js`:

```js
export default async function handler(req, res) {
  const { email } = JSON.parse(req.body);
  await fetch(`https://us1.api.mailchimp.com/3.0/lists/YOUR_LIST_ID/members`, {
    method: "POST",
    headers: {
      Authorization: `Bearer YOUR_API_KEY`,
      "Content-Type": "application/json",
    },
    body: JSON.stringify({ email_address: email, status: "subscribed" }),
  });
  res.status(200).json({ ok: true });
}
```

Option 2 — Resend + simple database (easiest for a founder):

1. Sign up at resend.com — free tier sends you an email for every capture
2. In `pages/api/subscribe.js`:

```js
```

```
import { Resend } from "resend";
const resend = new Resend(process.env.RESEND_API_KEY);
export default async function handler(req, res) {
  const { email } = JSON.parse(req.body);
  await resend.emails.send({
    from: "noreply@sentrixi.com",
    to: "oded@sentrixi.com",
    subject: "New demo request",
    text: `Email: ${email}`,
  });
  res.status(200).json({ ok: true });
}
```

3. Add `RESEND_API_KEY=your_key` to Vercel → Settings → Environment Variables

Ongoing updates

Every time you edit `SentrixiApp.jsx` and push to GitHub:

```bash
git add .
git commit -m "Updated hero copy"
git push
```

Vercel / Cloudflare auto-deploys within 60 seconds. No manual steps needed.
